

QUALITY ASSURANCE TESTING REPORT

QA Testing Report

Full application walkthrough — Phase 1

Prepared for: OwnlyNest — Property Management App

Prepared by: Mohsin Ismail, QA

Report date: August 6, 2026

Build reviewed: OwnlyNest mobile app, August 2026
build

Executive Summary

This report covers a full walkthrough of the OwnlyNest app — onboarding, document capture and AI extraction, property and project management, tenant and rent tracking, reporting, and account settings. In total we logged 21 findings, each with reproduction steps, expected versus actual behaviour, supporting evidence, and a recommended fix.

Top priority: One finding — session data isolation at sign-in (Finding 03) — is a release-blocking security issue and should be treated as the top priority before any further client-facing testing.

A second group of findings shows that several core features (document upload and AI extraction, notifications, rent collection, report generation, and property invitations) are visually complete but not yet functionally reliable. A third group covers role-based onboarding and tenant/vendor workflows that were reported as not working by the client — we have expanded these below with the exact roles and workflows affected, since they carry direct impact on which users can successfully onboard and use the app. A fourth group covers UI polish — inconsistent card styling, missing navigation controls, placeholder copy, and unbranded in-app links — which affects how premium and trustworthy the app feels even where the underlying logic works.

We recommend a focused fix sprint against every finding below, prioritising Finding 03, followed by a full regression pass before the next client demo or release.

FINDINGS AT A GLANCE

#	FINDING	SEVERITY	AREA
01	Splash screen branding needs a final pass	UI Polish	Onboarding
02	"Your Goals" onboarding screen needs UX polish	UI Polish	Onboarding
03	Sign-in screen renders over stale account data	Release Blocking	Security
04	Home dashboard — profile menu and navigation styling	UI Polish	Dashboard
05	Document upload — camera capture fails	Functional	Records
06	Photo library upload sends the wrong image	Functional	Records
07	AI document extraction does not read the uploaded image	Functional	Records / AI
08	"Choose file" does not upload the selected document	Functional	Records
09	Notifications are duplicated and can't be managed	Functional	Notifications
10	Reports list shows duplicate entries with an incorrect date	Functional	Reports
11	Report download opens outside the app	Functional	Reports
12	Contractor form fields are hidden behind the keyboard	UI Polish	Contractors
13	Tenants & Leases — no payment confirmation, no date picker	Functional	Tenants
14	Draft placeholder text is still live across production forms	UI Polish	Multiple
15	In-app web links are not on a branded OwnlyNest domain	UI Polish	Branding
16	Rent Collection shows incorrect amounts and status	Functional	Rent
17	Accepting a property invitation fails	Functional	Properties
18	Terms of Service & Privacy Policy open outside the app	UI Polish	Legal
19	Only one onboarding role works end-to-end	Client-Reported	Onboarding
20	Tenants can't review their assigned property or lease	Client-Reported	Tenants
21	Vendor job assignment and status tracking is missing	Client-Reported	Contractors

Detailed Findings

Twenty-one findings are documented below, each with reproduction steps, expected versus actual behaviour, supporting evidence, and a recommended fix.

FINDING 01

Splash screen branding needs a final pass

UI Polish

WHAT WE TESTED

- Installed the app and looked at the app icon on the home screen and in the app drawer.
- Launched the app cold and read the logo, tagline, and description text on the welcome screen.

EXPECTED

The app icon should match the official OwnlyNest brand mark, and the welcome copy should be concise, on-brand, and free of awkward phrasing.

WHAT WE FOUND

The installed app icon doesn't match the in-app logo's quality and style, and the welcome screen tagline reads like placeholder draft copy rather than final marketing copy.

RECOMMENDED FIX

Replace the Android and iOS app icon set with the final approved logo at all required resolutions, and have the marketing and content team finalize and proofread the welcome screen copy before the next build.

Welcome screen — logo and tagline

FINDING 02

"Your Goals" onboarding screen needs UX polish

UI Polish

WHAT WE TESTED

- Completed sign-up and reached the Your Goals screen (Homeowner, Landlord, and Active Flipper).
- Tapped each of the three role cards in turn to see how the screen responded.
- Looked for a way to go back or skip this step.

EXPECTED

Each card should follow the app's design system — spacing, radius, shadow, typography — and clearly show which role is selected once tapped. A Back button and a Skip option should let the user leave this step.

WHAT WE FOUND

- Card styling is inconsistent with the rest of the app's visual language and looks unfinished.
- Tapping Homeowner, Landlord, or Active Flipper renders the identical design every time — there's no visual change to confirm which role was actually selected.
- No Back or Skip control is present, so the user can't exit or revisit this step.

RECOMMENDED FIX

Apply the design system's card component (spacing, radius, elevation) with a distinct selected-state border and fill in the brand colour, plus a check icon that updates immediately on tap. Add a top-left Back button with an optional "Skip for now" link.

"Your Goals" screen — all three role cards

Sign-in screen renders over stale account data

Release Blocking

WHAT WE TESTED

- Opened the app and reached the Sign In screen.
- Observed what was visible behind and around the sign-in form before completing login.

EXPECTED

Before a user is authenticated, the Sign In screen should be the only thing on screen — no property portfolio or account data should be rendered underneath it.

WHAT WE FOUND

The Sign In form appeared as a translucent overlay on top of a fully-loaded Home dashboard — complete with a property name, address, and account initials — before sign-in was completed. This points to session and account state not being cleared or scoped correctly between accounts, which is a data isolation risk and must be verified against the backend authentication and query-scoping logic.

RECOMMENDED FIX

Audit session handling so the Sign In screen is shown on a clean, unauthenticated view with no cached dashboard state underneath it. Confirm every API call is scoped strictly to the authenticated user_id server-side, add regression tests for cross-account data isolation, and treat this as a blocker for the next release.

Sign In screen rendered over cached account data

Home dashboard — profile menu and navigation styling

UI Polish

WHAT WE TESTED

- Logged in and landed on the Home dashboard.
- Tapped the account initials in the top-right corner.
- Compared the active-tab colour in the bottom navigation across Home, Records, Projects, and More.

EXPECTED

The profile icon should open an account menu (edit profile, settings, sign out). The bottom navigation's active-tab colour should follow the app's brand palette consistently on every tab.

WHAT WE FOUND

- Tapping the profile initials does nothing — there's no edit, settings, or sign-out menu.
- The active-tab highlight colour in the bottom navigation is inconsistent between sections.

RECOMMENDED FIX

Wire the profile icon to an account menu (Edit profile / Settings / Sign out), and standardize the bottom navigation's active-state colour to a single brand token across all tabs.

Home dashboard — profile icon, top right

Document upload — camera capture fails, layout needs alignment

Functional

WHAT WE TESTED

- Opened Records > Upload and reviewed the layout of the Upload button and action list.
- Tapped "Take photo" to capture a receipt with the camera.

EXPECTED

The upload action buttons should be visually aligned with the rest of the screen, and tapping "Take photo" should open the camera and return the captured image for upload.

WHAT WE FOUND

"Take photo" doesn't return an image — the screen shows a persistent "Camera did not return a photo" error, and the "Upload & extract" button stays disabled. The action buttons above it are also inconsistently spaced compared to the rest of the app.

RECOMMENDED FIX

Fix the camera integration so the captured image is returned to the upload flow (check runtime permissions and the camera intent/URI handoff), clear the error state once a photo is captured, and align the button spacing with the app's standard form layout.

Upload screen — camera error blocks upload

Photo library upload sends the wrong image for extraction

Functional

WHAT WE TESTED

- Opened Records > Upload, selected a property, and tapped "Photo library."
- Picked a specific photo from Google Photos / the device gallery.
- Opened the Review screen to check which image and which extracted fields came back.

EXPECTED

The exact photo the user picks from the library should be the one uploaded and sent for AI extraction, and the Review screen should show that same image with fields read from it.

WHAT WE FOUND

- After picking a photo from the library, the Review screen doesn't display the selected receipt at all — instead it shows an unrelated image (a game screenshot in our test run) that the user never selected.
- The extracted Title and Amount fields are built from that wrong image's filename rather than any real text on a document — for example, Title "1000084456" and Amount "10000844.56" are clearly the same digits, not a real vendor name or receipt total.
- The Vendor field is left blank, and AI confidence still shows 72% despite the data being meaningless.

RECOMMENDED FIX

Fix the image-picker integration so the asset the user actually selects is what gets passed to the upload and extraction pipeline — check for a cached or default asset being used instead of the picker's result. Once the correct image reaches the OCR step, add a sanity check so a filename-shaped string is never written into Title or Amount, and confidence should drop (not stay at 72%) when the extracted text doesn't resemble a real document.

Google Photos picker open, property selected

Review screen — wrong data extracted, Vendor left blank

AI document extraction does not read the uploaded image

Functional

WHAT WE TESTED

- Uploaded a receipt via camera and photo library, and watched the extraction step run.
- Opened the Review screen and checked the extracted vendor, amount, and date fields.

EXPECTED

OCR + AI should extract the real vendor, amount, date, and description from the document, or clearly flag "no text detected" when it can't.

WHAT WE FOUND

Extracted fields come back incorrect or nonsensical — for example, the Title field gets filled with the raw filename and the Amount has no relation to the document — and the processing screen gives no meaningful feedback while this is happening.

RECOMMENDED FIX

Verify the OCR step actually receives the uploaded image and returns real text, confirm the extraction prompt is using that OCR output, and add a fallback to a "no text detected — enter manually" flow instead of writing garbage data.

Review screen — incorrect extracted fields

Processing screen gives no useful feedback

"Choose file" does not upload the selected document

Functional

WHAT WE TESTED

- Opened Records > Upload and tapped "Choose file."
- Selected a specific PDF or image from device storage.
- Checked the Review screen against the file that was actually selected.

EXPECTED

The exact file the user picks through "Choose file" should be the one uploaded and processed — matching filename, content, and page count where relevant.

WHAT WE FOUND

The data returned after using "Choose file" doesn't match the file the user actually selected, which is the same symptom seen in Finding 06 for the photo library picker — this looks like a shared bug in how the app hands off a picked file to the upload pipeline, rather than two separate issues.

RECOMMENDED FIX

Fix the document-picker integration to pass the selected file's URI/content correctly to the upload API, and add error handling for unsupported file types. Because this mirrors Finding 06, we'd recommend the engineering team check whether both the photo picker and the file picker are hitting the same broken hand-off code path — fixing it once may resolve both findings.

Evidence pending
Screen recording to be captured on the next test pass, using the same repro pattern as Finding 06.

Notifications are duplicated and can't be managed

Functional

WHAT WE TESTED

- Opened More > Notifications.
- Reviewed the listed notifications and tried "Mark all read."

EXPECTED

Notifications should reflect real events, each with clear text, and "Mark all read" should update their state.

WHAT WE FOUND

The same "Report ready" notification appears multiple times, one entry shows a raw internal ID string instead of readable text ("14c61b2a cd34 43b3..."), and "Mark all read" doesn't visibly change anything.

RECOMMENDED FIX

De-duplicate notification events at the source, replace the raw-ID message with a human-readable template (e.g. "Your document was processed and needs review"), and confirm "Mark all read" updates the backend read-state and re-renders the list.

Notifications — duplicates and a raw-ID message

Reports list shows duplicate entries with an incorrect date

Functional

WHAT WE TESTED

- Opened More > Reports and generated an Annual Property Summary.
- Reviewed the list of previously generated reports.

EXPECTED

Each generated report should appear once, timestamped with the actual date it was generated.

WHAT WE FOUND

Three identical "Annual Property Summary — Completed" entries are listed, all dated a day ahead of the device's current date.

RECOMMENDED FIX

Make the report-generation endpoint idempotent per request (no duplicate rows written), and confirm the report timestamp uses the server's UTC time converted to the user's local timezone rather than a fixed offset.

Reports — three duplicate entries, same date

Report download opens outside the app instead of in-app

Functional

WHAT WE TESTED

- Generated an Annual Property Summary report.
- Tapped "Download report."

EXPECTED

The PDF should open in an in-app viewer, styled to match the app, for a native app experience.

WHAT WE FOUND

The report opens in an external browser tab pointed at a raw storage URL, with no OwnlyNest branding and a floating edit icon that doesn't belong on a generated report.

RECOMMENDED FIX

Serve the signed report URL through an in-app PDF viewer (or the native share sheet) instead of an external browser redirect, and remove the stray edit control from the generated document view.

Annual Summary opened outside the app

Contractor form fields are hidden behind the keyboard

UI Polish

WHAT WE TESTED

- Opened More > Contractors and started the "New contractor" form.
- Tapped into the lower fields (Trade, Email, Phone) while the keyboard was open.

EXPECTED

The form should scroll so the field being edited stays visible above the keyboard.

WHAT WE FOUND

The form appears fixed in place — the Trade field and everything below it is covered by the keyboard — and the field's placeholder text ("Trade (plumber, HVAC...)") is also still a generic draft string.

RECOMMENDED FIX

Wrap the Contractors form in a scroll view combined with keyboard-avoiding behaviour so the active field always scrolls into view, and finalize the placeholder copy as part of the content pass in Finding 14.

New contractor form — keyboard covers the Trade field

Tenants & Leases — no payment confirmation, no date picker

Functional

WHAT WE TESTED

- Opened More > Tenants & Leases and created a new lease with a payment amount.
- Looked for confirmation that the lease or payment was saved successfully.
- Checked the date field used for the lease start date.

EXPECTED

The app should confirm the lease and its payment were created successfully, and the date field should use a native picker rather than free-typed text.

WHAT WE FOUND

- There's no success confirmation after creating a lease, so it's unclear whether the payment record was actually saved.
- The date field only accepts raw typed text (YYYY-MM-DD) with no picker, making it easy to enter an invalid date.

RECOMMENDED FIX

Add a clear success or failure confirmation after lease creation, verify the underlying payment webhook fires correctly, and replace the plain text date input with a native date picker for lease start and end dates.

Tenants & Leases — new lease form

FINDING 14

Draft placeholder text is still live across production forms

UI Polish

WHAT WE TESTED

- Opened the New Project form (Projects tab) and the New Task form (Calendar & Tasks).
- Reviewed the placeholder/hint text shown in each empty input field.

EXPECTED

All placeholder text should be final, reviewed copy appropriate for users to see in production.

WHAT WE FOUND

Multiple forms still show generic draft placeholders — for example "Kitchen remodel" and "Scope, notes, contractor details" in New Project, and a bare "Task title" field with no example in New Task — none of which read as finished, reviewed copy.

RECOMMENDED FIX

Run a single content pass across all forms (Projects, Tasks, Contractors, Properties) to replace placeholder text with clear, finalized hint copy before the app is shown to end users or the client.

New Project — draft placeholder copy

New Task — generic placeholder field

FINDING 15

In-app web links are not on a branded OwnlyNest domain

UI Polish

WHAT WE TESTED

- Opened the legal pages from within the app and checked the URL used.

EXPECTED

Shared and in-app links should use a clean, branded domain (e.g. app.ownlynest.com) that builds user trust.

WHAT WE FOUND

Links currently point to a default Firebase hosting address (ownlynest.web.app), which looks generic and unfinished when it appears in the browser's address bar.

RECOMMENDED FIX

Configure a custom branded domain for the app's hosted legal pages, and route all in-app views and shared links through it.

Legal page on the default web.app domain

FINDING 16

Rent Collection shows incorrect amounts and status

Functional

WHAT WE TESTED

- Opened More > Rent and reviewed the collected and overdue totals against the individual entries.

EXPECTED

Rent Collection should show accurate collected and overdue totals, and each entry's paid amount and status should match reality.

WHAT WE FOUND

The overdue total shows \$1,200 while every individual entry displays \$0.00 / \$0.00 and remains marked "Pending" even after using "Mark paid," and a stray "Already paid" message appears with no entry it relates to.

RECOMMENDED FIX

Confirm the rent/income endpoints correctly persist and return the paid amount and status per entry, fix the totals calculation so it matches the listed entries, and tie the "Already paid" message to the specific entry it refers to (or remove it if it's leftover debug text).

Rent screen — totals don't match entry status

FINDING 17

Accepting a property invitation fails

Functional

WHAT WE TESTED

- Opened More > Accept property invitation.
- Pasted a shared invitation token and confirmed.

EXPECTED

A valid invitation should display the property's name and address and let the invited user accept it, gaining the assigned role.

WHAT WE FOUND

The invitation couldn't be accepted — the app returned "Invitation not found or already used" even on a token that had not been used before.

RECOMMENDED FIX

Audit the invitation lookup and expiry logic end-to-end (token generation, storage, and the accept endpoint), and once fixed, update the screen to show the property's name and address instead of a raw ID so the user knows what they're accepting.

Accept Invitation — token rejected as invalid

FINDING 18

Terms of Service & Privacy Policy open outside the app

UI Polish

WHAT WE TESTED

- Tapped Terms of Service and Privacy Policy from the signup and More screens.

EXPECTED

Legal pages should open inside the app — a native screen or in-app web view matching the app's look and feel.

WHAT WE FOUND

Both links open the device's external browser instead of an in-app page, taking the user out of the app to read required legal content.

RECOMMENDED FIX

Build dedicated in-app screens or an in-app web view for Terms of Service and Privacy Policy so users never have to leave the app to read them.

Privacy Policy — opened externally

Only one onboarding role works end-to-end

Pending QA Verification

WHAT WE TESTED

- Client-reported issue, flagged during a walkthrough call — QA has not yet reproduced this with screenshots.
- Of the three roles offered on the "Your Goals" screen (see Finding 02), only the Landlord path was confirmed working through property setup.

EXPECTED

Selecting any of the three roles should tailor the first property setup correctly and let the user complete onboarding, with each role's setup reflecting what that role is meant to track:

Landlord Organize rental income, expenses, and property records in one vault. ✓ WORKING	Homeowner Track improvements, warranties, and cost basis for a primary home. ✗ BROKEN	Active Flipper Capture rehab receipts, contractor work, and project costs per property. ✗ BROKEN
---	---	--

WHAT WE FOUND

According to the client, selecting Homeowner or Active Flipper does not complete onboarding the way Landlord does — the setup appears to break or fails to tailor correctly for those two roles. This means two of the app's three target user types cannot currently onboard successfully, which directly affects the app's ability to serve homeowners and property flippers — not just landlords — at launch.

RECOMMENDED FIX

QA to reproduce the Homeowner and Active Flipper onboarding paths end-to-end, capture screenshots at the point each one breaks, and log the specific error/behaviour. Engineering should then confirm each role has its own working setup flow — not just Landlord — before this is considered release-ready for all three user types.

Reported verbally by the client; QA to reproduce and attach screenshots before the next report update.

Evidence pending
QA to capture screenshots of the Homeowner and Active Flipper onboarding breakpoints on the next test pass.

Tenants can't review their assigned property or lease

Pending QA Verification

WHAT WE TESTED

- Client-reported issue, flagged during a walkthrough call — QA has not yet reproduced this with screenshots.

EXPECTED

A tenant should be able to open their account and see the property and lease they're attached to — address, landlord contact, rent amount, and lease dates — tied to the same Tenants & Leases data covered in Finding 13.

WHAT WE FOUND

According to the client, this tenant-facing review flow is missing entirely — tenants currently have no way to see the property or lease details they've been assigned to. This is significant because it removes a core piece of the app's value for the tenant side of the relationship, not just the landlord side, and could affect trust and adoption among tenant users.

RECOMMENDED FIX

QA to confirm whether a tenant-facing view exists anywhere in the app; if not, this needs to be scoped as a new screen showing the tenant's assigned property, lease terms, and payment history, built on top of the existing Tenants & Leases data model.

Reported verbally by the client; QA to reproduce and attach screenshots before the next report update.

Evidence pending
QA to confirm whether a tenant-facing view exists and capture screenshots on the next test pass.

Vendor job assignment and status tracking is missing

Pending QA Verification

WHAT WE TESTED

- Client-reported issue, flagged during a walkthrough call — QA has not yet reproduced this with screenshots.
- Related to the Contractors directory covered in Finding 12, which currently only stores vendor contact details.

EXPECTED

Beyond just saving a vendor's contact details, the app should let a property owner assign a vendor to a specific job, and track that job through to completion — for example job submitted, in progress, issue resolved.

WHAT WE FOUND

According to the client, there's currently no way to assign a role or a job to a vendor, and no status tracking for work that's been submitted or resolved — the Contractors feature only goes as far as storing a name, trade, and contact info. This gap means the app currently supports contact storage but not the actual job-management workflow property owners rely on to coordinate maintenance and repairs.

RECOMMENDED FIX

Scope a job-assignment layer on top of the existing Contractors directory: assign a vendor to a property/project, set a job status (Submitted / In progress / Resolved), and surface that status back to the property owner. QA to reproduce the current gap and attach screenshots before the next report update.

Reported verbally by the client; QA to reproduce and attach screenshots before the next report update.

Evidence pending
QA to confirm current Contractors feature scope and capture screenshots on the next test pass.

Overall Assessment & Next Steps

Across this walkthrough, the app's visual foundation — colour palette, typography, and card-based layout — is a solid starting point, but several screens still carry inconsistent spacing, unfinished component states, and draft placeholder copy that read as unpolished to an end user. More importantly, a number of core features — document upload and AI extraction, notifications, rent collection, report generation, and property invitations — are not yet functioning reliably, and Finding 03 represents a genuine data-isolation risk that should be resolved and verified first. On top of that, the client has flagged role-based onboarding and tenant/vendor workflows (Findings 19-21) that QA still needs to reproduce and document properly — these affect real user types (homeowners, flippers, tenants, and vendors), not just edge cases, so they carry real weight for how ready the app is across its full audience.

RECOMMENDED SEQUENCE

1. **Fix and verify Finding 03 immediately** — this is a release-blocking security issue and takes priority over everything else.
2. **Reproduce and document Findings 19-21 with the client** so they have full repro steps and evidence for the Homeowner/Active Flipper onboarding gap, the missing tenant view, and vendor job tracking.
3. **Resolve the remaining functional findings** — uploads, extraction, notifications, rent collection, invitations, reports.
4. **Complete the UI polish and content pass** — placeholder copy, card styling, branded in-app links, in-app legal pages.
5. **Run a full regression pass** before the next client demo or release.

Prepared by Mohsin Ismail, QA — OwnlyNest Testing Report, August 6, 2026.
